Pearson iLit Summative Research

Pearson strongly believes that its programs should be proven through scientific research to increase student achievement. As such, it contracted with the independent research group Gatti Evaluation to conduct a longitudinal randomized, control trial of its *iLit* literacy program. This study was conducted in 7th grade classrooms over the 2013-14 school year and in 8th grade classrooms during the 2014-15 school year. This report summary presents an excerpt of findings from the interim report, including: the evaluation design and methods, a description of program usage and implementation, student performance results, and a discussion of the findings of results from the New York site. The full results of the report, *iLit 2013-15 Longitudinal Efficacy Study*, can be found on the Pearson Ed (www.pearsoned.com) website.

Study Design and Research Questions

The purpose of this study is to assess the longitudinal effectiveness of the *iLit* literacy program in helping students attain critical literacy skills and to document usage and implementation of the *iLit* program. The study employed an experimental randomized, control trial research design. That is, students within each research school were *randomly assigned* to either use the *iLit* program with their students (also referred to as the “treatment” group) or to continue using their current school literacy program (also referred to as the “comparison” condition).

The study addressed the following overarching evaluation questions:

1. Do middle school students receiving core literacy instruction from the *iLit* program over the course of the initial and second school year of implementation demonstrate a significant improvement in achievement?
2. Do middle school students receiving core literacy

- instruction from the *iLit* program over the course of the initial and second school year of implementation demonstrate a significant improvement in achievement over otherwise similar students in classrooms using their current literacy programs and methods (i.e., not fully digital)?
3. Do students receiving *iLit* instruction demonstrate positive attitudes toward reading and literacy instruction?
 4. How are teachers implementing the *iLit* program and how can this information inform program revisions and best practice?
 5. How did teachers and students react to the *iLit* program?

Participants and Setting

Gatti Evaluation recruited six schools to participate in the study, including schools in AZ, CA, CO, MI, NJ and NY. The NY site included three teachers and 81 students by the end of the second year. This was a decrease from 89 students in the first year due to students exiting the study. The study schools were members of public school districts located in suburban and urban areas. The study sample from NY demonstrated considerable variation in ethnicity and socioeconomic status as evidenced by eligibility for free or reduced lunch status. Figure 1 presents the NY school sample demographics broken out by *iLit* and comparison students.

Figure 1. New York Year 2 Site Demographics

	iLit		Comparison	
	Count	Percent	Count	Percent
African-American	11	29%	10	23%
Hispanic	27	71%	31	72%
Other	0	0%	2	5%
ELL	16	42%	23	53%
Free/Reduced Lunch	35	92%	37	86%

Measures

Multiple measures were used to assess student achievement, program implementation, and student attitudes.

Evaluators selected the Group Reading Assessment and Diagnostic Evaluation (GRADE) to measure changes in student literacy skills because of its broad visibility and acceptance in the field and high technical merit. The GRADE is a standardized, norm-referenced assessment that is group-administered. It offers parallel forms, with Form A administered within one month of the start of school and Form B administered within one month of the conclusion of school. The GRADE is not a timed test, but generally takes 50 – 90 minutes to complete. The GRADE offers an overall Literacy score, as well as four subtests: Vocabulary, Sentence Comprehension, Passage

Comprehension, and Listening Comprehension. The GRADE was administered three times during the school year. Form A was administered in the fall and spring and Form B was administered mid-year.

In order to measure program implementation and teacher perceptions, evaluators collected data through observations, surveys, and interviews with literacy teachers. Literacy teachers (treatment and comparison) also completed weekly implementation logs. This information provided researchers with a detailed data source on what was occurring in treatment and comparison classrooms in terms of literacy instruction, and allowed researchers to identify areas of overlap in terms of content taught and activities. The biannual classroom observations and interviews or focus groups with classroom teachers provided critical insight into the nature of use and the effectiveness of the literacy materials used with treatment and comparison students.

Additionally, student academic attitude surveys were administered in the fall and spring of the study year. The survey was developed by Gatti Evaluation, and included questions related to general literacy attitude, confidence, motivation, and self-perceived aptitude.

Student Performance Results

Year 1 Results for iLit Students

Students using *iLit* achieved gains in reading achievement after one year of program implementation. All *iLit* students in grade 7 experienced *statistically significant* gains on the GRADE Total, the four subtests (i.e., Vocabulary, Sentence Comprehension, Listening Comprehension, and Passage Comprehension) and on Total Comprehension.

Gains are represented as percentile ranks for an *iLit* student scoring *above* the average baseline score. *iLit* students gained 29 percentiles on the GRADE Total Score and 15 percentiles on Vocabulary test after one year of using *iLit*. Additionally, *iLit* students gained 28 percentiles on the Total Comprehension test, 17 percentiles on the Sentence Comprehension, 36 percentiles on the Listening Comprehension subtest and 25 percentiles on the Passage Comprehension subtest.

Year 1 Results for iLit as Compared to Other Reading Programs

Evaluators conducted analyses to examine how *iLit* students performed in comparison to students using other reading programs. Results showed that 7th grade students using *iLit* made greater gains than their peers using other reading programs on the GRADE Total, three subtests (i.e., Vocabulary, Listening Comprehension, and Passage Comprehension) and on Total Comprehension.

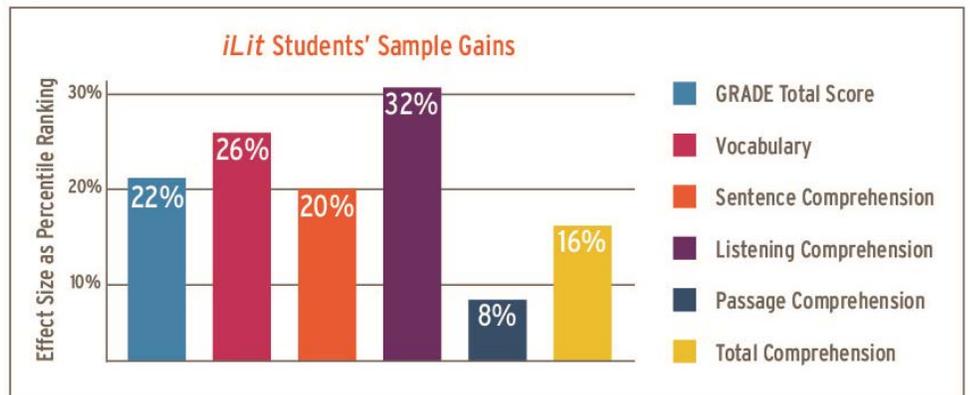

The average *iLit* student gained 9 percentiles more than the average comparison student on the GRADE Total Score and gained 5 percentiles more than the average comparison student on the Vocabulary test. Additionally, the average *iLit* student gained 13 percentiles on Listening Comprehension, 12 percentiles on Passage Comprehension, and gained 8 percentiles more than the average comparison student on their Total Comprehension scores.

Year2 Results for iLit Students

Students using *iLit* achieved gains in reading achievement after two years of program implementation. The gains increased in size during the second year of implementation for Vocabulary and Sentence Comprehension. All *iLit* students in grade 8 experienced gains on the GRADE Total, the four subtests (i.e., Vocabulary, Sentence Comprehension, Listening Comprehension and Passage Comprehension), and on Total Comprehension. *Statistically significant* gains were seen for GRADE Overall Score, Vocabulary, Sentence Comprehension, Listening Comprehension and Total Comprehension.

Gains are represented as percentile ranks for an *iLit* student scoring *above* the average baseline score. *iLit* students gained 22 percentiles in GRADE Total Score and 26 percentiles in Vocabulary after two years of use. Additionally *iLit* students gained 20 percentiles in Sentence Comprehension, 32 percentiles in Listening Comprehension, 8 percentiles in Passage Comprehension and 16 percentiles in Total Comprehension. (See Figure 1).

Figure 1. *iLit* Student Gains

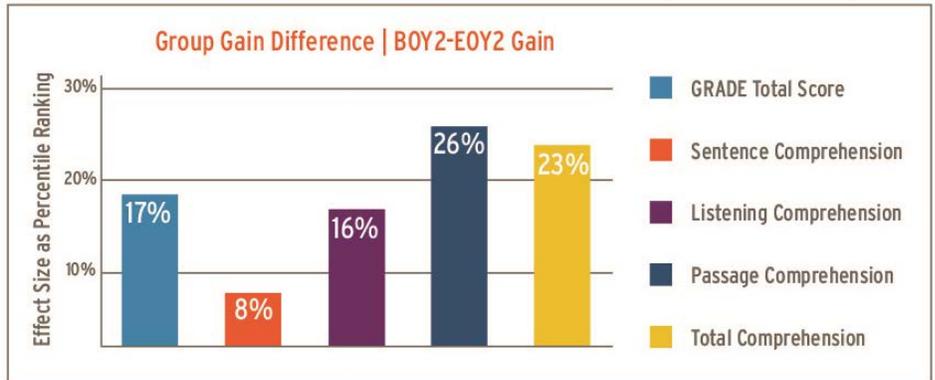

Year 2 Results for iLit as Compared to Other Reading Programs

Evaluators also conducted analyses to examine how *iLit* students performed in comparison to students using other reading programs after two years of implementation. Results showed that 8th grade students using *iLit* made greater gains than their peers using other reading programs on the GRADE Total Score and GRADE subtests of Sentence Comprehension, Listening Comprehension, Passage Comprehension and Total Comprehension. *Statistically significant* gains were seen for

GRADE Total Score, Passage Comprehension and Total Comprehension.

The average *iLit* student gained 17 percentiles more than the average comparison student on the GRADE Total test, 9 percentiles more than the average comparison student on the Sentence Comprehension test, 16 percentiles more than the average comparison student on the Listening Comprehension test, 26 percentiles more than the average comparison student on the Passage Comprehension test, and 23 percentiles more than the average comparison student on the Total Comprehension test. (See Figure 2).

Figure 2. Gain Difference Between *iLit* and Comparison Group

iLit Implementation

In Year 1, the *iLit* teachers implemented the *iLit* program with fidelity. The average daily implementation time of *iLit* was 86 minutes, and 65 full lessons were completed over the course of the school year.

This trend continued in Year 2. The *iLit* teachers implemented the *iLit* program with fidelity. The average implementation time of *iLit* was 45 minutes, and 61 full lessons were completed over the course of the school year.

Participant feedback

Student Attitudes

In addition to providing evidence of efficacy, Gatti Evaluation investigated other outcomes associated with use of the *iLit* program.

When *iLit* students were surveyed as to their opinions of the program, the majority demonstrated an overall positive attitude toward the *iLit* program. Several notable themes emerged, including; 91% of students reported they “definitely” or “sometimes” preferred *iLit* to their previous English class, 89% reported *iLit* was “definitely” or “sometimes” more interesting, and 59% wanted to continue using *iLit* next year.

Teacher Attitudes

The teacher response to the *iLit* program was also positive. The *iLit* teachers reported that almost all *iLit* lesson features were well worth the time, including: Vocabulary, Read Aloud/Think Aloud, Classroom Conversations, Whole Group Instruction, and Work Time. The only feature receiving a lower rating was Time To Read (Journals and Conferencing) which was reported somewhat worth the time. Additionally one teacher reported that students were taking their Interactive Reader assignments more seriously.

Conclusion

This study indicates that *iLit* is effective at significantly increasing student literacy achievement. The *iLit* teachers and students using *iLit* reported satisfaction with the program. In particular, the majority of students reported that they preferred the *iLit* program in comparison to their other English class, and the teachers found several of the *iLit* features well worth the instructional time. In sum, scientific research indicates that the *iLit* program is an effective and useful program for both teachers and students.

About Gatti Evaluation, Inc.

Gatti Evaluation was founded in 2003 to provide assistance in researching current topics in education and biomed. Gatti has extensive experience managing and consulting on large research projects for Fortune 500 companies and major academic institutions. Gatti researchers hold advanced degrees in Research Methods and Education. They also collaborate with numerous hand-picked, world-renowned researchers, practitioners, and academic research centers. Learn more at www.GattiEval.com.
